1 EXECUTIVE OVERVIEW	13
1.1 INTRODUCTION	14
1.2 AUDIT SUMMARY	14
1.3 TEST APPROACH & METHODOLOGY	14
RISK METHODOLOGY	15
1.4 SCOPE	17
2 ASSESSMENT SUMMARY & FINDINGS OVERVIEW	18
3 FINDINGS & TECH DETAILS	22
3.1 (HAL-01) DEBT CAN BE REPAYED WITH UNDERLYING TOKEN - MEDIUM	24
Description	24
Code Location	24
Scenario	25
Risk Level	25
Recommendation	25
Remediation Plan	25
3.2 (HAL-02) INCOMPATIBILITY WITH DEFLATIONARY TOKENS - MEDIUM	26
Description	26
Code Location	26
Risk Level	27
Recommendation	27
Remediation Plan	27
3.3 (HAL-03) CHAINLINK ORACLE RETURN VALUES ARE NOT HANDLED PROPERLY - MEDIUM	28

Description	28
Code Location	28
Scenario	29
Risk Level	29
Recommendation	29
Remediation Plan	30
3.4 (HAL-04) CHAINLINK ORACLE CAN CRASH WITH DECIMALS LONGER THAN 18 - MEDIUM	31
Description	31
Code Location	31
Proof Of Concept	32
Risk Level	32
Recommendation	32
Remediation Plan	32
3.5 (HAL-05) VERIFICATION OF NFT OWNER AND FLASH LOANS - MEDIUM	33
Description	33
Code Location	33
Proof Of Concept	34
Risk Level	34
Recommendation	34
Remediation Plan	34
3.6 (HAL-06) OWNER CAN EXTRACT ALL WRAPPED TOKEN FROM WRAPTOKEN-GATEWAY - MEDIUM	35
Description	35
Code Location	35
Proof Of Concept	35

Risk Level	36
Recommendation	36
Remediation Plan	36
3.7 (HAL-07) FLASHMINT FEE IS NOT ADJUSTED ACCORDING TO BPS - MEDIUM	
37	
Description	37
Code Location	37
Proof Of Concept	37
Risk Level	38
Recommendation	38
Remediation Plan	38
3.8 (HAL-08) DECREASE REPAY WITH BASE TOKEN LIMITER NOT USED - MEDIUM	
39	
Description	39
Code Location	39
Risk Level	40
Recommendation	40
Remediation Plan	40
3.9 (HAL-09) ALLOWLISTING ALLOWS ADMINS TO BLOCK WITHDRAWALS - MEDIUM	
41	
Description	41
Code Location	41
Proof Of Concept	42
Risk Level	42
Recommendation	42
Remediation Plan	42
3.10 (HAL-10) ATTACK ON HARVEST BY A MALICIOUS KEEPER - MEDIUM	
43	
Description	43

Code Location	43
Proof Of Concept	44
Risk Level	44
Recommendation	44
Remediation Plan	45
3.11 (HAL-11) CONFIGURE CREDITUNLOCKRATE EFFECTS IMMEDIATELY - MEDIUM	
Description	46
Code Location	46
Proof of Concept	46
Risk Level	47
Recommendation	47
Remediation Plan	47
3.12 (HAL-12) SETSAVVY WILL FREEZE DEPOSITED FUNDS - MEDIUM	48
Description	48
Code Location	48
Proof Of Concept	49
Risk Level	49
Recommendation	49
Remediation Plan	50
3.13 (HAL-13) REGISTERTOKEN MISUSE CAN PERMANENTLY DISABLE SAVVYSAGE AND BREAK THE SYSTEM - MEDIUM	51
Description	51
Code Location	51
Proof Of Concept	52
Risk Level	52

Recommendation	52
Remediation Plan	53
3.14 (HAL-14) SAVVYSAGE CALLS DEPOSITUNDERLYING WITH NO SLIPPAGE BOUNDS - MEDIUM	54
Description	54
Code Location	54
Proof Of Concept	54
Risk Level	55
Recommendation	55
Remediation Plan	55
3.15 (HAL-15) DECREASE ALLOWANCE WHEN ITS ALREADY SET TO NON-ZERO - LOW	56
Description	56
Code Location	56
Risk Level	57
Recommendation	57
Remediation Plan	57
3.16 (HAL-16) USE DISABLEINITIALIZERS TO PREVENT FRONT-RUNNING ON THE INITIALIZE FUNCTION - LOW	58
Description	58
Code Location	58
Risk Level	58
Recommendation	58
Remediation Plan	58
3.17 (HAL-17) OWNABLE CONTRACT HAS A SINGLE STEP OWNERSHIP TRANSFER - LOW	59

Description	59
Code Location	59
Risk Level	59
Recommendation	59
Remediation Plan	59
3.18 (HAL-18) ALLOWANCE GRANTED TO THE OLD ADAPTER SHOULD BE REVOKED WHEN SETTING THE NEW ADAPTER - LOW	60
Description	60
Code Location	60
Risk Level	61
Recommendation	61
Remediation Plan	61

EXECUTIVE OVERVIEW

1.1 INTRODUCTION

Savvy engaged [Halborn](#) to conduct a security audit on their smart contracts beginning on December 30th, 2022 and ending on January 31st, 2023 . The security assessment was scoped to the smart contracts provided in the [savvy](#) GitHub repository. Commit hashes and further details can be found in the Scope section of this report.

1.2 AUDIT SUMMARY

The team at Halborn was provided N weeks for the engagement and assigned the full-time security engineer to audit the security of the smart contracts in scope. The security engineer is a blockchain and smart contract security expert with advanced penetration testing and smart contract hacking skills, and deep knowledge of multiple blockchain protocols.

The purpose of this audit is to:

- Ensure that smart contract functions operate as intended.
- Identify potential security issues with the smart contracts.

In summary, Halborn identified some security risks that were mostly addressed by the Savvy team.

1.3 TEST APPROACH & METHODOLOGY

Halborn performed a combination of manual and automated security testing to balance efficiency, timeliness, practicality, and accuracy in regard to the scope of this audit. While manual testing is recommended to uncover flaws in logic, process, and implementation; automated testing techniques help enhance coverage of the code and can quickly identify items that do not follow the security best practices. The following phases and associated tools were used during the audit:

- Research into architecture and purpose.
- Smart contract manual code review and walkthrough.
- Graphing out functionality and contract logic/connectivity/functions. ([solgraph](#))
- Manual assessment of use and safety for the critical Solidity variables and functions in scope to identify any arithmetic related vulnerability classes.
- Manual testing by custom scripts .
- Scanning of solidity files for vulnerabilities, security hot-spots or bugs. ([MythX](#))
- Static Analysis of security for scoped contract, and imported functions. ([Slither](#))
- Testnet deployment. ([Brownie](#), [Remix IDE](#))

RISK METHODOLOGY:

Vulnerabilities or issues observed by Halborn are ranked based on the risk assessment methodology by measuring the **LIKELIHOOD** of a security incident and the **IMPACT** should an incident occur. This framework works for communicating the characteristics and impacts of technology vulnerabilities. The quantitative model ensures repeatable and accurate measurement while enabling users to see the underlying vulnerability characteristics that were used to generate the Risk scores. For every vulnerability, a risk level will be calculated on a scale of 5 to 1 with 5 being the highest likelihood or impact.

RISK SCALE - LIKELIHOOD

- 5 - Almost certain an incident will occur.
- 4 - High probability of an incident occurring.
- 3 - Potential of a security incident in the long term.
- 2 - Low probability of an incident occurring.
- 1 - Very unlikely issue will cause an incident.

RISK SCALE - IMPACT

- 5 - May cause devastating and unrecoverable impact or loss.
- 4 - May cause a significant level of impact or loss.

- 
- 3 - May cause a partial impact or loss to many.
 - 2 - May cause temporary impact or loss.
 - 1 - May cause minimal or un-noticeable impact.

The risk level is then calculated using a sum of these two values, creating a value of **10** to **1** with **10** being the highest level of security risk.

CRITICAL	HIGH	MEDIUM	LOW	INFORMATIONAL
----------	------	--------	-----	---------------

- 10** - CRITICAL
- 9** - **8** - HIGH
- 7** - **6** - MEDIUM
- 5** - **4** - LOW
- 3** - **1** - VERY LOW AND INFORMATIONAL

1.4 SCOPE

1. IN-SCOPE TREE & COMMIT :

Code repositories:

1. Savvy Defi

FINDINGS & TECH DETAILS

3.1 (HAL-01) DEBT CAN BE REPAYED WITH UNDERLYING TOKEN - MEDIUM

Description:

When an `underlyingToken` is used as collateral, the amount in terms of the `underlyingToken` (adjusted for decimals) will always be taken in a 1:1 ratio/price into `_totalValue`. We believe this design is flawed and can cause systemic failure when one of the `underlyingTokens` is severely `depegged`. Because when the `underlyingToken` is `depegged`, and the `svyToken` minted is worth more than the collateral `underlyingToken` in the market. The arbitrageur can simply `mint` and `dump` `svyToken` as much as they can and choose to abandon the collateral.

Code Location:

```
Listing 1: contracts/SavvyPositionManager.sol

1029 function _totalValue(address owner) internal view returns (
1030     uint256) {
1031     uint256 totalValue = 0;
1032     Sets.AddressSet storage depositedTokens = _accounts[owner]
1033         .depositedTokens;
1034     for (uint256 i = 0; i < depositedTokens.values.length; i
1035        ++) {
1036         address yieldToken = depositedTokens.values[i];
1037         uint256 shares = _accounts[owner].balances[yieldToken
1038         ];
1039         (
1040             address baseToken_,
1041             uint256 amountBaseTokens
1042         ) = _yieldStrategyManager.convertSharesToBaseTokens(
1043             yieldToken, shares);
1044         totalValue += _normalizeBaseTokensToDebt(baseToken_,
1045             amountBaseTokens);
1046     }
1047     return totalValue;
1048 }
```

```
| 045      }
```

Scenario:

- One collateral token used by Savvy experiences a severe de-pegging against other collaterals. For this example, we will assume DAI drops to 80 cents vs. USDC & USDT. svyUSD maintains its peg against USDC & USDT.
- Users can buy DAI off the market, deposit it into Savvy, take a loan, and repeat this loop until the minting cap is reached. Users can buy DAI off the market and use it to repay their loans until the repay cap is reached.
- Users can liquidate their current yDAI position (paying off their outstanding debt discounted), buy more DAI with their loan, deposit it into Savvy, take a loan, and repeat until the liquidation cap is reached. These arbitrage opportunities will likely result in one or more of the mint / repay / liquidate caps being met.

Risk Level:

Likelihood - 3

Impact - 4

Recommendation:

Consider using an oracle to query the market price of the `underlyingTokens`, and calculate the `_totalValue` based on the market price.

Remediation Plan:

RISK ACCEPTED: The `Savvy` team accepted the risk of this issue.

3.2 (HAL-02) INCOMPATIBILITY WITH DEFLATIONARY TOKENS - MEDIUM

Description:

We have discovered that the system is incompatible with deflationary tokens. These are tokens that are designed to reduce in supply over time, often through a process called “burning”, which permanently removes tokens from circulation.

The protocol relies on accurate token balances to function properly, and the changing supply of deflationary tokens causes issues with this. Specifically, we have noticed that transactions involving deflationary tokens are not being recorded correctly, leading to incorrect balances and potentially causing problems for our users.

Code Location:

Listing 2: contracts/SavvyLGE.sol

```
289   function _buy(
290       uint256 deposited,
291       address nftCollectionAddress,
292       uint256 nftId,
293       uint256 vestModeIndex
294   ) internal {
295       uint256 allotmentsPerDepositToken =
296       ↳ _getAllotmentsPerDepositToken(nftCollectionAddress, vestModeIndex)
297       ;
298       uint256 allotments = deposited * allotmentsPerDepositToken
299       ;
300
301       if (nftCollectionAddress != address(0)) {
302           NFTAllocationInfo storage nftAllocationInfo =
303           ↳ nftAllocationInfos[nftCollectionAddress][nftId];
304           if (!nftAllocationInfo.activated) {
305               _activate(nftCollectionAddress, nftId, deposited);
306           } else {
307               Checker.checkState(nftAllocationInfo.remaining >=
```

```
↳ deposited, "insufficient availability for nft");
304                     nftAllocationInfo.remaining -= deposited;
305                 }
306             }
307
308         _updateUserBuyInfo(deposited, allotments, vestModeIndex);
309         allotmentSupply += allotments;
310         totalDeposited += deposited;
311
312         emit AllotmentsBought(msg.sender, deposited, allotments);
313     }
```

Risk Level:

Likelihood - 1

Impact - 5

Recommendation:

It is mandatory to have this dynamic in mind when on-boarding new tokens to be able to track the token balances correctly.

Remediation Plan:

SOLVED: The Savvy team solved this issue by adding pre- / post-balance check.

Commit ID: 10cd1d78ab55b20e143323bdf7f0f7080fc48a8f

3.3 (HAL-03) CHAINLINK ORACLE RETURN VALUES ARE NOT HANDLED PROPERTY - MEDIUM

Description:

Chainlink oracle return values are not handled properly, the `priceFeed` will return the following variables:

- roundId
- answer
- startedAt
- updatedAt
- answeredInRound

These return values are meant to be used to do some extra checks before updating the price. By just receiving the price, you can get stale prices and incomplete rounds.

Code Location:

Listing 3: contracts/SavvyPriceFeed.sol

```
65
66     function _getChainlinkTokenPrice(
67         address priceFeed_
68     ) internal view returns (uint256) {
69         AggregatorV3Interface priceFeed = AggregatorV3Interface(
69     ↳ priceFeed_);
70         (,int price,,,)= priceFeed.latestRoundData();
71         uint256 tokenPrice = 0;
72         if (price > 0) {
73             tokenPrice = SafeCast.toUint256(price);
74         }
75
76         uint8 decimals = priceFeed.decimals();
77         uint8 additionDecimals = 18 - decimals;
78         return tokenPrice * 10**additionDecimals;
79     }
```

Scenario:

`_getChainlinkTokenPrice` calls out to a Chainlink oracle receiving the `latestRoundData()`. If there is a problem with Chainlink starting a new round and finding consensus on the new value for the oracle (e.g. Chainlink nodes abandon the oracle, chain congestion, vulnerability/attacks on the chainlink system) consumers of this contract may continue using outdated stale or incorrect data (if oracles are unable to submit no new round is started).

Risk Level:

Likelihood - 3

Impact - 3

Recommendation:

It is recommended to use this code to get all the values and sanitize the input.

Listing 4: contracts/SavvyPriceFeed.sol

```
65 (uint80 roundID ,answer,, uint256 timestamp, uint80
↳ answeredInRound) = AggregatorV3Interface(chainLinkAggregatorMap[
↳ underlying]).latestRoundData();
66
67 require(answer > 0, ""Chainlink price <= 0"");
68 require(answeredInRound >= roundID, ""Stale price"");
69 require(timestamp != 0, ""Round not complete"");"
```

Remediation Plan:

SOLVED: The Savvy team solved this issue. They added the recommended checks to check for stale prices and incomplete rounds.

Commit ID: [08ae4cde0e606121cbdbca9831c9cb430cf3155](#)

3.4 (HAL-04) CHAINLINK ORACLE CAN CRASH WITH DECIMALS LONGER THAN 18 - MEDIUM

Description:

If the `priceFeed` from `chainlink` returns 18 decimals or more, it will make the function crash or fail the calculation as the code is multiplying the token price by 18 minus the number of decimals of the `priceFeed`.

Code Location:

```
Listing 5: contracts/SavvyPriceFeed.sol

65     function _getChainlinkTokenPrice(
66         address priceFeed_
67     ) internal view returns (uint256) {
68         AggregatorV3Interface priceFeed = AggregatorV3Interface(
69             priceFeed_);
70         (
71             uint80 roundID,
72             int price,
73             uint256 timestamp,
74             uint80 answeredInRound
75         ) = priceFeed.latestRoundData();
76
77         require(price > 0, "Chainlink price <= 0");
78         require(answeredInRound >= roundID, "Stale price");
79         require(timestamp != 0, "Round not complete");
80
81         uint256 tokenPrice = uint256(price);
82
83         uint8 decimals = priceFeed.decimals();
84         uint8 additionDecimals = 18 - decimals;
85         return tokenPrice * 10**additionDecimals;
}
```

Proof Of Concept:

`_getChainlinkTokenPrice` gets the latest round information at that point, if the price feed returns a number of `decimals` ≥ 18 they will be set to `0`. That will make the transaction revert or return a `0 - token price`.

Risk Level:

Likelihood - 1

Impact - 5

Recommendation:

It is mandatory to not use any token with more than 18 decimals to avoid breaking the feed.

Remediation Plan:

SOLVED: The Savvy team solved this issue by adding the decimal check.

Commit ID: [08ae4cde0e606121cbdbca9831c9cb430cf3155](#)

3.5 (HAL-05) VERIFICATION OF NFT OWNER AND FLASH LOANS - MEDIUM

Description:

Suppose that the `NFT` is borrowed (via a flash loan), then there is temporary access to the `NFT` and the user can interact with the `buy` function. If an attacker discovers a `NFT` that has not claimed all the tokens that they can, he will be able to do a `flashloan` then call the `buy` function, getting the tokens and then returning the `NFT`.

Code Location:

Listing 6: contracts/SavvyLGE.sol

```

202     function buy(
203         uint256 amount,
204         address nftCollectionAddress,
205         uint256 nftId,
206         uint256 vestModeIndex
207     ) public override whenNotPaused lgeNotEnded nonReentrant {
208         Checker.checkState(block.timestamp >= lgeStartTimestamp, "
209             ↳ lge has not begun");
210         Checker.checkArgument(amount != 0, "amount is invalid");
211         Checker.checkArgument(vestModeIndex < vestModes.length, "
212             ↳ invalid vest mode index");
213         if (nftCollectionAddress != address(0)) {
214             Checker.checkArgument(nftCollectionInfos[
215                 ↳ nftCollectionAddress].limit != 0, "this NFT is not eligible for
216                 ↳ boost");
217             Checker.checkArgument(IERC721(nftCollectionAddress).
218                 ↳ ownerOf(nftId) == msg.sender, "buyer is not the owner of this NFT"
219             );
220         }
221         amount = TokenUtils.safeTransferFrom(address(depositToken)
222             , msg.sender, depositTokenWallet, amount);
223         _buy(amount, nftCollectionAddress, nftId, vestModeIndex);
224     }
225 
```

Proof Of Concept:

```
Listing 7: contracts/SavvyLGE.sol

289     function exploit(address _nftAddress, uint256 _nftId, uint256
290         ↳ _vestMode) {
291         // Get fake flashloan
292         uint256 flashloanAmount = 10;
293         vm.deal(attacker, flashLoanAmount);
294
295         savvyLGE.buy(10, _nftAddress, _nftId, _vestMode);
296
297         // sell tokens
298
299         // Return fake flashloan
300         ↳ vm.deal(attacker, (payable)(address.this).balance -
301             flashLoanAmount);
300     }
```

Risk Level:

Likelihood - 3

Impact - 3

Recommendation:

Keep in mind that this can be abused if you create any new functionality that could be profitable for the exploiter.

Remediation Plan:

RISK ACCEPTED: The Savvy team accepted the risk of this issue.

3.6 (HAL-06) OWNER CAN EXTRACT ALL WRAPPED TOKEN FROM WRAPTOKENGATEWAY - MEDIUM

Description:

The owner of the `WrapTokenGateway` contract can extract all existing `WrapToken` from the contract via the `refreshAllowance` method. These capabilities must be limited in favor of decentralization, in order to avoid loss of reputation or user confidence.

Code Location:

Listing 8: contracts/WrapTokenGateway.sol

```
53     function refreshAllowance(address savvy) external onlyOwner {  
54         require (ISavvyPositionManager(savvy).supportInterface(  
↳ type(ISavvyAdminActions).interfaceId), "not SavvyPositionManager  
↳ address");  
55         WAVAX.approve(savvy, type(uint256).max);  
56     }
```

Proof Of Concept:

Listing 9: contracts/SavvyLGE.sol

```
289     function exploit(address attackerAddress) {  
290         vm.prank(owner);  
291         wrapTokenGateway.refreshAllowance(attacker);  
292         WAVAX.withdraw(WAVAX.balanceOf(addressWrapTokenGateway()))  
↳ ;  
293     }
```

Risk Level:

Likelihood - 2

Impact - 4

Recommendation:

It is recommended a multisignature wallet / governance wallet or any other method to make sure that the owner's address does not get compromised.

Remediation Plan:

SOLVED: The [Savvy](#) team solved this issue. They changed the refreshAllowance logic to and added a removeAllowance method that can help when changing the signer.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.7 (HAL-07) FLASHMINT FEE IS NOT ADJUSTED ACCORDING TO BPS - MEDIUM

Description:

The `setFlashFee` does not use the BPS constant when setting the `newFee`, this will lead to miss calculating every number that depends on `flashMintFee` after `setFlashFee` it is called.

Code Location:

Listing 10: contracts/SavvySyntheticToken.sol

```
100   function setFlashFee(uint256 newFee) public onlyAdmin {  
101     Checker.checkArgument(newFee <= BPS, "invalid fee");  
102     flashMintFee = newFee;  
103     emit SetFlashMintFee(flashMintFee);  
104 }
```

Proof Of Concept:

Listing 11: contracts/SavvyLGE.sol

```
289   function exploit() {  
290     uint256 newFee = 10;  
291     uint256 BPS = 10000;  
292     vm.prank(admin);  
293     savvySyntheticToken.setFlashFee(10);  
294     // Here I compare the result with the BPS and the number  
↳ that we get in the contract  
295     vm.assertEq(savvySyntheticToken.flashMintFee, newFee/BPS);  
296 }
```

Risk Level:

Likelihood - 2

Impact - 5

Recommendation:

It is a must to add the BPS to the calculation of the fee in order to have the calculations working.

Listing 12: contracts/SavvySyntheticToken.sol

```
100   function setFlashFee(uint256 newFee) public onlyAdmin {  
101     Checker.checkArgument(newFee <= BPS, "invalid fee");  
102     flashMintFee = newFee/BPS;  
103     emit SetFlashMintFee(flashMintFee);  
104 }
```

Remediation Plan:

SOLVED: The Savvy team solved this issue. They added the BPS rate to the calculation, making the result correct.

Commit ID: 10cd1d78ab55b20e143323bdf7f0f7080fc48a8f

3.8 (HAL-08) DECREASE REPAY WITH BASE TOKEN LIMITER NOT USED - MEDIUM

Description:

During the code review, It has been noticed that `decreaseRepayWithBaseTokenLimiter` function is not used. On the other hand, the limiter is decreased after limit check on the `repayWithBaseToken` function. Furthermore, in the `repayWithCollateral` token does not decrease limiter.

Code Location:

Listing 13: contracts/YieldStrategyManager.sol

```
401   function repayWithBaseToken(
402       address baseToken,
403       uint256 amount,
404       int256 debt
405   ) external onlySavvyPositionManager returns (uint256, uint256)
406   {
407       // Determine the maximum amount of base tokens that can be
408       // repaid.
409       //
410       // It is implied that this value is greater than zero
411       // because `debt` is greater than zero so a noop is not possible
412       // beyond this point. Casting the debt to an unsigned
413       // integer is also safe because `debt` is greater than zero.
414       uint256 maximumAmount = _normalizeDebtTokensToUnderlying(
415       baseToken, uint256(debt));
416
417       // Limit the number of base tokens to repay up to the
418       // maximum allowed.
419       uint256 actualAmount = amount > maximumAmount ?
420       maximumAmount : amount;
421
422       // Check to make sure that the base token repay limit has
423       // not been breached.
```

```
416         uint256 _currentRepayWithBaseTokenLimit = _repayLimiters[  
417             baseToken].get();  
418         if (actualAmount > _currentRepayWithBaseTokenLimit) {  
419             revert RepayLimitExceeded(baseToken, actualAmount,  
420             _currentRepayWithBaseTokenLimit);  
421         }  
422  
423         uint256 credit = _normalizeBaseTokensToDebt(baseToken,  
424             actualAmount);  
425  
426         // Decrease the amount of the base token which is  
427         // globally available to be repaid.  
428         _repayLimiters[baseToken].decrease(actualAmount);  
429  
430         return (credit, actualAmount);  
431     }
```

Risk Level:

Likelihood - 3

Impact - 3

Recommendation:

It is recommended to delete the function or call it from `repayWithBaseToken` and `repayWithCollateral` instead of decreasing it there.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They changed the code to call `decreaseRepayWithBaseTokenLimiter` from the functions instead of writing the logic inside.

Commit ID: 10cd1d78ab55b20e143323bdf7f0f7080fc48a8f

3.9 (HAL-09) ALLOWLISTING ALLOWS ADMINS TO BLOCK WITHDRAWALS - MEDIUM

Description:

Allowlisting allows admins to block withdrawals. After some time of operation, the admins turn off allowlisting, allowing full integration by any smart contract. A small DeFi platform started integrating with SavvyDefi. Users using contract-based wallets and solutions like Gnosis Safe start using SavvyDefi. Then, due to a perceived risk, the SavvyDefi admins turn the allowlist back on. The small platform and the end users are now blocked from withdrawing funds, or interacting at all with the contracts in any way, and are at the mercy of the admins.

Code Location:

Listing 14: contracts/SavvyPositionManager.sol

```
1164     function _withdrawYieldToken(
1165         address owner,
1166         address yieldToken,
1167         uint256 shares,
1168         address recipient
1169     ) internal returns (uint256) {
1170         _onlyAllowlisted();
1171         Checker.checkArgument(recipient != address(0), "zero
↳ recipient address");
1172         _yieldStrategyManager.checkSupportedYieldToken(yieldToken)
↳ ;
1173
1174         uint256 amountYieldTokens = _withdraw(yieldToken, owner,
↳ shares, recipient);
1175         TokenUtils.safeTransfer(yieldToken, recipient,
↳ amountYieldTokens);
1176
1177         return amountYieldTokens;
1178     }
```

Proof Of Concept:

Listing 15: contracts/SavvyPositionManager.sol

```
289 function exploit() {
290     vm.prank(victim);
291     uint256 tokenAmount = yieldToken.balanceOf(victim);
292     savvyPositionManager.depositBaseToken(address(yieldToken),
293     ↳ tokenAmount, victim, tokenAmount);
293     vm.prank(owner);
294     allowlist.remove(victim);
295     vm.expectRevert(bytes("Unauthorized"));
296     savvyPositionManager.withdrawYieldToken(address(yieldToken),
297     ↳ tokenAmount, victim);
297 }
```

Risk Level:

Likelihood - 2

Impact - 5

Recommendation:

It is recommended to use a multisignature wallet or any other method to make sure that the owner's address doesn't get compromised.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They removed the allowlist check on the withdraw, meaning that the users will be able to remove the funds.

Commit ID: 10cd1d78ab55b20e143323bdf7f0f7080fc48a8f

3.10 (HAL-10) ATTACK ON HARVEST BY A MALICIOUS KEEPER - MEDIUM

Description:

Keeper are highly trusted entities that are intended to be either immutable smart contracts, upgradeable smart contracts with trusted governance, or EOAs or multisigs with trust assumptions similar to governance addresses. Whales can perform an attack on harvests, but it is usually infeasible. However, if a keeper account is compromised or acts maliciously, it can easily steal almost an entire harvest by flash loaning tokens, making a large deposit in the SavvyDefi, triggering a harvest, withdrawing the deposit, and repaying the flash loan in one transaction. To perform this attack on a yield token, a keeper would need to take out a large flash loan, buy a large amount of the yield token, deposit it in SavvyDefi, trigger a harvest, withdraw the yield tokens, and sell them before repaying the flash loan.

Code Location:

Listing 16: contracts/SavvyPositionManager.sol

```
681     function harvest(address yieldToken, uint256 minimumAmountOut
682 ) external override lock {
683     _onlyKeeper();
684
685     (
686         address baseToken_,
687         uint256 amountBaseTokens,
688         uint256 feeAmount,
689         uint256 distributeAmount,
690         uint256 credit
691     ) = _yieldStrategyManager.harvest(
692         yieldToken,
693         minimumAmountOut,
694         protocolFee
695     );
696
697     // Transfer the tokens to the fee receiver and savvySwap.
```

```
697         TokenUtils.safeTransfer(baseToken_, protocolFeeReceiver,
698             feeAmount);
698         TokenUtils.safeTransfer(baseToken_, savvySwap,
699             distributeAmount);
699
700         // Inform the savvySwap that it has received tokens.
701         IERC20TokenReceiver(savvySwap).onERC20Received(baseToken_,
702             distributeAmount);
702
703         emit Harvest(yieldToken, minimumAmountOut,
704             amountBaseTokens, credit);
704     }
```

Proof Of Concept:

Listing 17: contracts/SavvyLGE.sol

```
289     function exploit() {
290         uint256 tokenAmount = yieldToken.balanceOf(
291             savvyPositionManager);
291
292         savvyPositionManager.depositBaseToken(address(yieldToken),
293             tokenAmount, attacker, tokenAmount);
293         savvyPositionManager.harvest(address(yieldToken), tokenAmount)
294             ;
294         savvyPositionManager.withdrawYieldToken(address(yieldToken),
295             tokenAmount, attacker);
295     }
```

Risk Level:

Likelihood - 1

Impact - 5

Recommendation:

It is recommended to have the keeper's access well-secured to avoid misuse of the trust.

FINDINGS & TECH DETAILS

Remediation Plan:

RISK ACCEPTED: The Savvy team accepted the risk of this issue.

3.11 (HAL-11) CONFIGURE CREDITUNLOCKRATE EFFECTS IMMEDIATELY - MEDIUM

Description:

If the `configureCreditUnlockRate` function is called to increase the rate, it will take effect immediately. However, the proportion of `distributedCredit` and `pendingCredit` will remain unchanged. As a consequence, every call to this function, `harvest`, `repay*` is going to revert.

Code Location:

Listing 18: contracts/YieldStrategyManager.sol

```

296     function configureCreditUnlockRate(address yieldToken, uint256
297         blocks) external onlySavvyPositionManager {
298         Checker.checkArgument(blocks > 0, "zero blocks");
299         _checkSupportedYieldToken(yieldToken);
300         _yieldTokens[yieldToken].creditUnlockRate =
301             FIXED_POINT_SCALAR / blocks;
302     }

```

Proof of Concept:

Listing 19

```

1  function exploit() {
2      vm.startPrank(address(savvyPositionManager));
3      yieldStrategyManager.configureCreditUnlockRate(yieldToken,
4          numBlocks);
5      vm.expectRevert();
6      yieldStrategyManager.harvest(yieldToken, minimumAmount, 0);
7  }

```

FINDINGS & TECH DETAILS

Risk Level:

Likelihood - 3

Impact - 4

Recommendation:

It is recommended to call `configureCreditUnlockRate` whenever the proportion of `distributedCredit` and `pendingCredit` is updated.

Remediation Plan:

RISK ACCEPTED: The Savvy team accepted the risk of this issue.

3.12 (HAL-12) SETSAVVY WILL FREEZE DEPOSITED FUNDS - MEDIUM

Description:

Currently, `setSavvy` doesn't check whether there are any open positions left with the old savvy before switching to the new one. As this requires several checks, the probability of operational mistake isn't low, and it's prudent to introduce the main controls directly to the code to minimize it. In the case if the system goes on with new Savvy before realizing that there are some funds left in the old one, tedious and error-prone manual recovery will be needed. There is also going to be corresponding reputational damage. Setting the severity to medium as while the function is admin only, the impact is up to massive user fund freeze, i.e., this is system breaking with external assumptions.

Code Location:

Listing 20: contracts/SavvySage.sol

```

235   function setSavvy(address _savvy) external override onlyAdmin {
236       sources[_savvy] = false;
237       sources[_savvy] = true;
238
239       if (savvy != address(0)) {
240           for (uint256 i = 0; i < registeredBaseTokens.length; i++)
241               TokenUtils.safeApprove(registeredBaseTokens[i],
242                                     savvy, 0);
243           TokenUtils.safeApprove(debtToken, savvy, 0);
244       }
245
246       savvy = _savvy;
247       yieldStrategyManager = ISavvyPositionManager(savvy).
248       yieldStrategyManager();
249       for (uint256 i = 0; i < registeredBaseTokens.length; i++)
250   }
```

```
249             TokenUtils.safeApprove(registeredBaseTokens[i], savvy,
250             ↳ type(uint256).max);
251             TokenUtils.safeApprove(debtToken, savvy, type(uint256).max
252             ↳ );
253             emit SetSavvy(savvy);
254 }
```

Proof Of Concept:

Savvy implementation change can happen while open deposits are remaining with the current contract. As there looks to be no process to transfer them in the code, such SavvySage funds will be frozen with old savvy:

Listing 21: contracts/SavvySage.sol

```
235     function setSavvy(address _savvy) external override onlyAdmin {
236         vm.startPrank(admin);
237         savvySage.setSavvy(address(newSavvy));
238         // Here we can not access the funds of the old savvy from
239         ↳ the sage and they are stucked
239     }
```

Risk Level:

Likelihood - 2

Impact - 4

Recommendation:

It is recommended to require that all exposure to the old savvy is closed, for example, both `getAvailableFlow` and `getTotalCredit` is zero.

FINDINGS & TECH DETAILS

Remediation Plan:

SOLVED: The Savvy team solved this issue. They added a check to see if there are any positions on the old savvy swap before making the change.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.13 (HAL-13) REGISTERTOKEN MISUSE CAN PERMANENTLY DISABLE SAVVYSAGE AND BREAK THE SYSTEM - MEDIUM

Description:

SavvySage's `refreshStrategies()` is the only way to actualize `_yieldTokens` array. The function requires `registeredUnderlyings` array to match current Savvy's `_supportedUnderlyingTokens`. At the same time, `registeredUnderlyings` can only be increased via `registeredBaseTokens()`: there is no way to reduce, remove or reconstruct the array. This way, if `registerToken()` was mistakenly called extra time or savvyst was switched with `setSavvy` to a new one with less supported assets, then the strategy refresh becomes impossible and the `SavvySage` be blocked as it cannot be properly used without synchronization with Savvy. The redeployment of the contract doesn't provide an easy fix, as it holds the accounting data that needs to be recreated (`flowAvailable`, `currentExchanged` mappings).

Code Location:

Listing 22: contracts/SavvyLGE.sol

```

367     function refreshStrategies() public override {
368         address[] memory supportedYieldTokens =
369             yieldStrategyManager
370                 .getSupportedYieldTokens();
371         address[] memory supportedBaseTokens =
372             yieldStrategyManager
373                 .getSupportedBaseTokens();
374
375         Checker.checkState(registeredBaseTokens.length ==
376             supportedBaseTokens.length, "invalid base tokens information");
377
378         // clear current strats
379         for (uint256 j = 0; j < registeredBaseTokens.length; j++)
380             {
381                 delete _yieldTokens[registeredBaseTokens[j]];
382             }

```

```
379
380     uint256 numYTokens = supportedYieldTokens.length;
381     for (uint256 i = 0; i < numYTokens; i++) {
382         address yieldToken = supportedYieldTokens[i];
383
384         ISavvyPositionManager.YieldTokenParams memory params =
385             yieldStrategyManager
386                 .getYieldTokenParameters(yieldToken);
387         if (params.enabled) {
388             _yieldTokens[params.baseToken].push(yieldToken);
389         }
390     }
391 }
```

Proof Of Concept:

Listing 23: contracts/SavvyLGE.sol

```
289     function exploit() {
290         vm.startPrank(admin);
291         savvySage.registerToken(baseToken, address(savvySwap));
292         savvySage.registerToken(baseToken, address(savvySwap));
293         savvySage.registerToken(baseToken, address(savvySwap));
294         vm.stopPrank();
295         vm.expectRevert("invalid base tokens information");
296         savvySage.refreshStrategies();
297     }
```

Risk Level:

Likelihood - 3

Impact - 3

Recommendation:

It is a must careful when calling `registerToken` to not do any extra call or add a function to remove `registeredBaseTokens` from the array.

FINDINGS & TECH DETAILS

Remediation Plan:

SOLVED: The Savvy team solved this issue. They added a remove base token function to be able to make the system functional again.

Commit ID: [65140e9b2859285d98ec1c3945309ab189689d57](#)

3.14 (HAL-14) SAVVYSAGE CALLS DEPOSITUNDERLYING WITH NO SLIPPAGE BOUNDS - MEDIUM

Description:

If the buffer (SavvySage) is called during an unfavorable time, then a large portion of deposited funds may be lost due to slippage because deposit is called with 0 as the minimum out allowing any level of slippage

Code Location:

Listing 24: contracts/SavvyLGE.sol

```
486     function _savvyDeposit(address token, uint256 amount) internal
487     {
488         ISavvyPositionManager(savvy).depositBaseToken(
489             token,
490             amount,
491             address(this),
492             0
493         );
494     }
```

Proof Of Concept:

Imagine that the market is having a huge volatility currently that you call the deposit function. It will call the `depositBaseToken` function with a 0 in the slippage parameter. Due to these conditions, your amount deposited on the position manager will be very different from the amount that you introduced as an argument when you were calling `_savvyDeposit` and there is no way to control that from the user side.

FINDINGS & TECH DETAILS

Risk Level:

Likelihood - 3

Impact - 3

Recommendation:

It is recommended to slippage / minimum out as a user's parameter.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They added a `minOut` variable that enables the user to set slippage bonds to avoid the loss of funds.

Commit ID: [9843e94c709aef44a4bfafc7e238c24dba3a2fe7](#)

3.15 (HAL-15) DECREASE ALLOWANCE WHEN ITS ALREADY SET TO NON-ZERO - LOW

Description:

We have noticed that when attempting to decrease the allowance for a given token using the `decreaseAllowance` function, it only works if the allowance is already set to zero. If the allowance is set to a non-zero value, the function does not properly decrease the allowance. Non-standard tokens like USDT will revert the transaction when a contract or a user tries to approve an allowance when the spender allowance is already set to a non-zero value. For that reason, the previous allowance should be decreased before increasing allowance in the related function.

Code Location:

```
Listing 25: contracts/YieldStrategyManager.sol

303     function setTokenAdapter(address yieldToken, address adapter)
304         external onlySavvyPositionManager {
305             address oldAdapter = _yieldTokens[yieldToken].adapter;
306             Checker.checkState(yieldToken == ITokenAdapter(adapter).
307                 token(), "invalid yield token address");
308             Checker.checkState(ITokenAdapter(oldAdapter).baseToken()
309                 == ITokenAdapter(adapter).baseToken(), "invalid base token address
310                 ");
311             _checkSupportedYieldToken(yieldToken);
312
313             TokenUtils.safeApprove(yieldToken, oldAdapter, 0);
314             TokenUtils.safeApprove(ITokenAdapter(oldAdapter).baseToken()
315                 (), oldAdapter, 0);
316             TokenUtils.safeApprove(yieldToken, adapter, type(uint256).
317                 max);
318             TokenUtils.safeApprove(ITokenAdapter(adapter).baseToken(),
319                 adapter, type(uint256).max);
320         }
```

```
316         _yieldTokens[yieldToken].adapter = adapter;
317     }
```

Risk Level:

Likelihood - 2

Impact - 2

Recommendation:

It is recommended to do a study of the tokens that you will use to avoid non-standard tokens like USDT.

Remediation Plan:

SOLVED: The Savvy team solved this issue by setting allowance to zero first.

Commit ID: 839f3858f7726fba6a3570bb0ecca5d5c1e3383e

3.16 (HAL-16) USE DISABLEINITIALIZERS TO PREVENT FRONT-RUNNING ON THE INITIALIZE FUNCTION - LOW

Description:

Use `disableInitializers` to prevent front-running on the initialize function, as it would make you deploy the smart contract again if someone initializes it before you.

Code Location:

All the smart contracts.

Risk Level:

Likelihood - 3

Impact - 1

Recommendation:

It is recommended to disable initializers to prevent front-running on the initialize function.

Remediation Plan:

SOLVED: The [Savvy team](#) solved this issue. They disabled the initializers, so the possibility of doing front-run is not enabled.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.17 (HAL-17) OWNABLE CONTRACT HAS A SINGLE STEP OWNERSHIP TRANSFER - LOW

Description:

The `transferOwnership` function transfers contract ownership in a single step. If the owner of a contract were set to an address not controlled by the SavvyDefi Team, the contract would be impossible to recover.

Code Location:

All the smart contracts.

Risk Level:

Likelihood - 1

Impact - 3

Recommendation:

It is recommended to a two-step process in which an owner proposes an ownership transfer and the proposed new owner accepts it.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They changed the process to a two-step verification to be able to have control over the flow.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.18 (HAL-18) ALLOWANCE GRANTED TO THE OLD ADAPTER SHOULD BE REVOKED WHEN SETTING THE NEW ADAPTER - LOW

Description:

Allowance granted to the old adapter should be revoked when setting the new adapter to avoid unexpected behaviors and abuses.

Code Location:

Listing 26: contracts/YieldStrategyManager.sol

```
303     function setTokenAdapter(address yieldToken, address adapter)
304         external onlySavvyPositionManager {
305             address oldAdapter = _yieldTokens[yieldToken].adapter;
306             Checker.checkState(yieldToken == ITokenAdapter(adapter).
307             token(), "invalid yield token address");
308             Checker.checkState(ITokenAdapter(oldAdapter).baseToken()
309             == ITokenAdapter(adapter).baseToken(), "invalid base token address
310             ");
311             _checkSupportedYieldToken(yieldToken);
312
313             TokenUtils.safeApprove(yieldToken, oldAdapter, 0);
314             TokenUtils.safeApprove(ITokenAdapter(oldAdapter).baseToken()
315             (), oldAdapter, 0);
316             TokenUtils.safeApprove(yieldToken, adapter, type(uint256).
317             max);
318             TokenUtils.safeApprove(ITokenAdapter(adapter).baseToken(),
319             adapter, type(uint256).max);
320             _yieldTokens[yieldToken].adapter = adapter;
321         }
```

Risk Level:

Likelihood - 2

Impact - 3

Recommendation:

It is recommended to revoke the allowance to the old adapter when setting the new one.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They remove the allowance when setting the new adopter.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.19 (HAL-19) MISSING SANITY CHECK FOR THE NEW ADAPTER - LOW

Description:

The new adapter should be checked for a matching `underlyingToken` to avoid setting an incompatible adapter. If, for some reason, you set an adapter with another `underlyingToken` it will not be compatible and break the protocol.

Code Location:

Listing 27: contracts/YieldStrategyManager.sol

```
299     function setTokenAdapter(address yieldToken, address adapter)
300         external onlySavvyPositionManager {
301             address oldAdapter = _yieldTokens[yieldToken].adapter;
302             Checker.checkState(yieldToken == ITokenAdapter(adapter).
303             token(), "invalid yield token address");
304             Checker.checkState(ITokenAdapter(oldAdapter).baseToken()
305             == ITokenAdapter(adapter).baseToken(), "invalid base token address
306             ");
307             _checkSupportedYieldToken(yieldToken);
308
309             TokenUtils.safeApprove(yieldToken, oldAdapter, 0);
310             TokenUtils.safeApprove(ITokenAdapter(oldAdapter).baseToken
311             (), oldAdapter, 0);
312             TokenUtils.safeApprove(yieldToken, adapter, type(uint256).
313             max);
314             TokenUtils.safeApprove(ITokenAdapter(adapter).baseToken(),
315             adapter, type(uint256).max);
316             _yieldTokens[yieldToken].adapter = adapter;
317         }
```

Risk Level:

Likelihood - 2

Impact - 3

Recommendation:

It is recommended to add a check to see if the token adapter underlying asset is the same one as the old one.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They added the sanity check to see if the underlying collateral is the same as the new adapter.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.20 (HAL-20) USE GRANTROLE INSTEAD OF SETUPROLE - LOW

Description:

According to OpenZeppelin documentation, `_setupRole()` is only to be called from the constructor while `_grantRole()` is to be called anywhere else, doing otherwise is circumventing the admin system.

Code Location:

Listing 28: contracts/SavvyLGE.sol

```
126     function setAllowedMinter(address minter, bool state) external
127         ↳ onlyAdmin {
128             Checker.checkArgument(minter != address(0), "zero minter
129             ↳ address");
130             if (state) {
131                 _grantRole(MINTER_ROLE, minter);
132             } else {
133                 _revokeRole(MINTER_ROLE, minter);
134             }
135 }
```

Risk Level:

Likelihood - 2

Impact - 3

Recommendation:

It is recommended to use `grantRole` instead of `setupRole`.

FINDINGS & TECH DETAILS

Remediation Plan:

SOLVED: The Savvy team solved this issue. They changed the code from `grantrole` to `setuprole`.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.21 (HAL-21) UPGRADEABLE CONTRACTS ARE NOT INITIALIZED - LOW

Description:

In the project, the `ReentrancyGuardUpgradeable` and `AccessControlUpgradeable` upgradeable contracts are not initialized.

Code Location:

Listing 29

```
1 ./SavvySwap.sol:27:contract SavvySwap is ISavvySwap,  
↳ ReentrancyGuardUpgradeable, AccessControlUpgradeable {}  
2 ./SavvyActionBatcher.sol:13:contract SavvyActionBatcher is  
↳ ISavvyActionBatcher, OwnableUpgradeable {}  
3 ./YieldStrategyManager.sol:16:contract YieldStrategyManager is  
↳ IYieldStrategyManager, Mutex, OwnableUpgradeable {}  
4 ./SavvySage.sol:27:contract SavvySage is ISavvySage,  
↳ AccessControlUpgradeable {  
5 ./WrapTokenGateway.sol:17:contract WrapTokenGateway is  
↳ IWrapTokenGateway, OwnableUpgradeable {}  
6 ./InfoAggregator.sol:25:contract InfoAggregator is IInfoAggregator  
↳ , OwnableUpgradeable {}
```

Risk Level:

Likelihood - 2

Impact - 3

Recommendation:

Consider initializing the all upgradeable contracts in the initializer of the contract.

FINDINGS & TECH DETAILS

Remediation Plan:

SOLVED: The Savvy team solved this issue. They initialized the contracts.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.22 (HAL-22) NO STORAGE GAP FOR UPGRADEABLE CONTRACT - LOW

Description:

For upgradeable contracts, there must be a storage gap to “allow developers to freely add new state variables in the future without compromising the storage compatibility with existing deployments” (quote OpenZepelin). Otherwise, it may be very difficult to write new implementation code. Without storage gap, the variable in the child contract might be overwritten by the upgraded base contract if new variables are added to the base contract. This could have unintended and serious consequences on the child contracts, potentially causing loss of user funds or cause the contract to malfunction completely. However, none of these contracts contain a storage gap.

Refer to the bottom part of this article: [writing-upgradeable](#)

Code Location:

Listing 30

```
1 ./SavvySwap.sol:27:contract SavvySwap is ISavvySwap,  
↳ ReentrancyGuardUpgradeable, AccessControlUpgradeable {}  
2 ./SavvyActionBatcher.sol:13:contract SavvyActionBatcher is  
↳ ISavvyActionBatcher, OwnableUpgradeable {}  
3 ./YieldStrategyManager.sol:16:contract YieldStrategyManager is  
↳ IYieldStrategyManager, Mutex, OwnableUpgradeable {}  
4 ./SavvySage.sol:27:contract SavvySage is ISavvySage,  
↳ AccessControlUpgradeable {  
5 ./WrapTokenGateway.sol:17:contract WrapTokenGateway is  
↳ IWrapTokenGateway, OwnableUpgradeable {}  
6 ./InfoAggregator.sol:25:contract InfoAggregator is IIInfoAggregator  
↳ , OwnableUpgradeable {}
```

Recommendation:

Consider adding a storage gap at the end of the upgradeable abstract contract.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They added gaps of size 100 to fix this issue.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.23 (HAL-23) LACK OF ALLOWLIST CHECK ON THE OWNER ADDRESS - LOW

Description:

The current system lacks a crucial security measure in the form of an allowlist check on the owner's address. This means that any address can potentially act as the owner and change the smart contract, regardless of whether they are authorized to do so. The deposit function does not check if the owner is allow-listed on the contract. With the following scenario, a depositor could not withdraw funds from the contract.

- Depositor calls deposit function with non-allow-listed address (as an owner).
- Depositor is trying to call withdraw function.
- Depositor cannot withdraw due to owner address is not white-listed.

Code Location:

SavvySwap.sol#L211

Listing 31

```
1  function deposit(uint256 amount, address owner) external
2    override nonReentrant {
3      _onlyAllowlisted();
4      amount = TokenUtils.safeTransferFrom(syntheticToken, msg.
5      sender, address(this), amount);
6      _updateAccount(
7        UpdateAccountParams({
8          owner: owner,
9          unswappedDelta: SafeCast.toInt256(amount),
10         swappedDelta: 0
11       }));
12     emit Deposit(msg.sender, owner, amount);
13   }
```

Recommendation:

Consider checking If the owner's address is white-listed.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They changed the code to see if the owner is allowlisted instead of the msg.sender.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.24 (HAL-24) DEPOSITS CAN NOT BE PAUSED ON THE SWAP CONTRACT - LOW

Description:

It has been reported that deposits into the swap contract cannot be paused, even when necessary. This is a critical issue as there may be situations where it is necessary to temporarily halt deposits for maintenance or security reasons. The inability to pause deposits on the swap contract can lead to potential security risks, as well as increased workload for the team responsible for managing the contract.

Code Location:

/contracts/SavvySwap.sol#L206

Listing 32

```
1   function deposit(uint256 amount, address owner) external
2     override nonReentrant {
3       _onlyAllowlisted();
4       amount = TokenUtils.safeTransferFrom(syntheticToken, msg.
5         sender, address(this), amount);
6       _updateAccount(
7         UpdateAccountParams({
8           owner: owner,
9           unswappedDelta: SafeCast.toInt256(amount),
10          swappedDelta: 0
11        }));
12      emit Deposit(msg.sender, owner, amount);
13    }
```

Risk Level:

Likelihood - 2

Impact - 2

Recommendation:

It is recommended to implement a mechanism that allows deposits to be paused in the swap contract.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They added a way to stop deposits.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.25 (HAL-25) VAULT LOSS SCENARIO - LOW

Description:

If a yield-bearing asset experiences a loss in the underlying collateral, the `maxLoss` function will get activated and automatic changes will be triggered that can create a total amount of funds lost from the vault.

We will assume a 10% loss of `DAI` from the `ysvyDAI` vault that is unrecoverable. After the transaction that causes the loss is committed to the chain, the `maxLoss()` is triggered and the following happens:

The following `ysvyDAI` Savvy functions are automatically disabled:

- `deposit()`
- `depositUnderlying()`
- `withdrawUnderlying()`
- `withdrawUnderlyingFrom()`
- `liquidate()`
- `harvest()`

The following `ysvyDAI` Savvy functions are still usable:

- `withdraw()`
- `withdrawFrom()`
- `repay()`
- `mint()`
- `burn()`

Code Location:

```
Listing 33: contracts/SavvyPositionManager.sol

1029  function _totalValue(address owner) internal view returns (
1030      uint256) {
1031     uint256 totalValue = 0;
1032     Sets.AddressSet storage depositedTokens = _accounts[owner]
```

```
↳ ].depositedTokens;
1033         for (uint256 i = 0; i < depositedTokens.values.length; i
1034             ++
1035             address yieldToken = depositedTokens.values[i];
1036             uint256 shares = _accounts[owner].balances[yieldToken
1037             ];
1038             (
1039                 address baseToken_ ,
1040                 uint256 amountBaseTokens
1041             ) = _yieldStrategyManager.convertSharesToBaseTokens(
1042                 yieldToken, shares);
1043             totalValue += _normalizeBaseTokensToDebt(baseToken_ ,
1044                 amountBaseTokens);
1045 }
```

Risk Level:

Likelihood - 2

Impact - 2

Recommendation:

It is recommended to have on-chain monitoring to be able to react fast if this situation happens.

Remediation Plan:

RISK ACCEPTED: The Savvy team accepted the risk of this issue.

3.26 (HAL-26) REDUNDANT HARDHAT/CONSOLE.SOL IMPORT - INFORMATIONAL

Description:

In the contracts, `hardhat/console` is imported to several places. In the production environment, It is recommended to delete `hardhat/console`.

Code Location:

All the contracts.

Risk Level:

Likelihood - 1

Impact - 1

Recommendation:

Consider deleting hardhat console import.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They removed the duplicated import.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.27 (HAL-27) OPTIMAL COMPARISON - INFORMATIONAL

Description:

When comparing integers, it is cheaper to use strict `>` & `<` operators over `≥` & `≤` operators, even if you must increment or decrement one of the operands. Note: before using this technique, it's important to consider whether incrementing/decrementing one of the operators could result in an over/underflow.

This optimization is applicable when the optimizer is turned off.

Code Location:

It is located in multiple locations inside the following contracts:

Listing 34

- 1 - VeERC20Upgradeable.sol
- 2 - VeSvy.sol
- 3 - YieldStrategyManager.sol

Risk Level:

Likelihood - 1

Impact - 1

Recommendation:

It is recommended to refactor the integers comparisons with strict operators.

FINDINGS & TECH DETAILS

Remediation Plan:

SOLVED: The Savvy team solved this issue. They changed the integer comparisons with strict operators to have better gas costs.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.28 (HAL-28) OPTIMAL MULTIPLICATIONS AND DIVISIONS BY POWERS OF 2 - INFORMATIONAL

Description:

Right shift or Left shift instead of dividing or multiplying by powers of two.

Code Location:

It is located on multiple locations inside the following contracts:

- VeERC20Upgradeable.sol
- VeSvy.sol
- YieldStrategyManager.sol
- Allowlist.sol

Risk Level:

Likelihood - 1

Impact - 1

Recommendation:

It is recommended to use shifting instead of multiplying by powers of 2 to reduce the gas consumption.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They moved from multiplications by powers of 2 to shifting.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.29 (HAL-29) OPTIMISATION OF IFS AND ZERO ADDRESS - INFORMATIONAL

Description:

It is redundant to check `if(x == true)` or any form of boolean comparison. You can slightly reduce gas consumption by using `if (x)` instead. When applicable, you can also use assembly to save more gas by using `iszeroiszero(x)` instead of `if (x)` and `iszero(x)` for `if (!x)`.

Code Location:

You can find this issue in lines 32 and 40 of Allowlist.

Listing 35: contracts/utils/Allowlist.sol

```
29
30  /// @inheritdoc IAllowlist
31  function add(address caller) external override {
32      _onlyAdmin();
33      Checker.checkState(disabled == false, "add allowlist is
↳ disabled");
34      addresses.add(caller);
35      emit AccountAdded(caller);
36  }
37
38  /// @inheritdoc IAllowlist
39  function remove(address caller) external override {
40      _onlyAdmin();
41      Checker.checkState(disabled == false, "add allowlist is
↳ disabled");
42      addresses.remove(caller);
43      emit AccountRemoved(caller);
44  }
```

Risk Level:

Likelihood - 1

Impact - 1

Recommendation:

It is recommended to refactor the code of the boolean comparisons to reduce the gas consumption.

Remediation Plan:

PARTIALLY SOLVED: The Savvy team solved the issue partially.

3.30 (HAL-30) PACK STRUCTS - INFORMATIONAL

Description:

When creating structs, make sure that the variables are listed in ascending order by data type. The compiler will pack the variables that can fit into one 32 byte slot. If the variables are not listed in ascending order, the compiler may not pack the data into one slot, causing additional `sload` and `sstore` instructions when reading/storing the struct into the contract's storage.

Code Location:

You can find this issue in lines 8 and 15 of `ISavvyTokenParams.sol`.

Listing 36: contracts/interfaces/savvy/ISavvyTokenParams.sol

```
8     /// @notice Defines base token parameters.
9     struct BaseTokenParams {
10         uint8 decimals;
11         uint256 conversionFactor;
12         bool enabled;
13     }
14
15     /// @notice Defines yield token parameters.
16     struct YieldTokenParams {
17         uint8 decimals;
18         address baseToken;
19         address adapter;
20         uint256 maximumLoss;
21         uint256 maximumExpectedValue;
22         uint256 creditUnlockRate;
23         uint256 activeBalance;
24         uint256 harvestableBalance;
25         uint256 totalShares;
26         uint256 expectedValue;
27         uint256 pendingCredit;
28         uint256 distributedCredit;
29         uint256 lastDistributionBlock;
```

```
30         uint256 accruedWeight;
31         bool enabled;
32     }
33 }
```

Risk Level:

Likelihood - 1

Impact - 1

Recommendation:

It is recommended to pack structs in ascending order.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They packed the structs of the specified file, saving gas on deployment.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.31 (HAL-31) USE CALldata INSTEAD OF MEMORY FOR FUNCTION ARGUMENTS THAT DO NOT GET MUTATED - INFORMATIONAL

Description:

Mark data types as `calldata` instead of memory where possible. This makes it so that the data is not automatically loaded into memory. If the data passed into the function does not need to be changed (like updating values in an array), it can be passed in as `calldata`. The one exception to this is if the argument must later be passed into another function that takes an argument that specifies memory storage.

Code Location:

You can find this issue in both `VeERC20Upgradeable` and `YieldStrategyManager`:

Listing 37: contracts/VeERC20Upgradeable.sol

```
36     function __ERC20_init(string memory name_, string memory
↳ symbol_) internal initializer {
37         __Context_init_unchained();
38         __ERC20_init_unchained(name_, symbol_);
39     }
40
41     function __ERC20_init_unchained(string memory name_, string
↳ memory symbol_) internal initializer {
42         _name = name_;
43         _symbol = symbol_;
44     }
```

Listing 38: contracts/YieldStrategyManager.sol

```
581
582     function setBorrowingLimiter(
```

```
583         Limitors.LinearGrowthLimiter memory borrowingLimiter_
584     ) external {
585         // This is first time so savvyPositionManager should be
586         ↳ zero.
587         if (savvyPositionManager != address(0)) {
588             revert Unauthorized();
589         }
590         _borrowingLimiter = borrowingLimiter_;
```

Risk Level:

Likelihood - 1

Impact - 1

Recommendation:

It is recommended to mark the data type as `calldata` instead of `memory`.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They changed from `memory` to `calldata` on places that didn't mutate the state, saving gas.

Commit ID: `10cd1d78ab55b20e143323bdf7f0f7080fc48a8f`

3.32 (HAL-32) USE ASSEMBLY TO CHECK FOR ADDRESS(0) - INFORMATIONAL

Description:

Use assembly to check for address(0) to make the gas fees lower.

Code Location:

You can apply this optimization in multiple smart contracts:

- YieldYakAdapter
- InfoAggregator
- SavvyActionBatcher
- SavvyLGE
- SavvyBooster
- SavvyPositionManager
- SavvyPriceFeed
- SavvyRedlist
- SavvySage
- SavvySyntheticToken
- VeERC20Upgradeable
- VeSvy
- YieldStrategyManager

Risk Level:

Likelihood - 1

Impact - 1

Recommendation:

It is recommended to create a helper function that checks if the address is `address(0)` and use it in all the functions that are doing the `if(address(0))` check to reduce gas costs.

Listing 39

```
1 function assemblyOwnerNotZero(address _addr) public pure {
2     assembly {
3         if iszero(_addr) {
4             mstore(0x00, "zero address")
5             revert(0x00, 0x20)
6         }
7     }
8 }
```

Remediation Plan:

ACKNOWLEDGED: The Savvy team acknowledged this issue.

3.33 (HAL-33) USE 1E18 INSTEAD OF 10**18 - INFORMATIONAL

Description:

It is recommended to use scientific notation (1e18) instead of exponential (10**18).

Code Location:

Listing 40: contracts/libraries/Math.sol

```
7     uint256 public constant WAD = 10**18;
```

Risk Level:

Likelihood - 1

Impact - 1

Recommendation:

It is recommended to change the code when initializing the variable:

Listing 41: contracts/libraries/Math.sol

```
7     uint256 public constant WAD = 10e18;
```

Remediation Plan:

SOLVED: The Savvy team solved this issue. They simply changed from 10**18 to 1E18.

Commit ID: [10cd1d78ab55b20e143323bdf7f0f7080fc48a8f](#)

3.34 (HAL-34) ADAPTER'S MAX SLIPPAGE VARIABLE IS NEVER USED - INFORMATIONAL

Description:

The variable `MAX_SLIPPAGE` on all the adapters it is never used, it should be removed to make the gas of the deployment cheaper.

Code Location:

All the adapters under `./contracts/adapters`.

Risk Level:

Likelihood - 1

Impact - 1

Recommendation:

It is recommended to remove the declaration of the `MAX_SLIPPAGE` variable.

Remediation Plan:

SOLVED: The Savvy team solved this issue. They removed the unused variable.

Commit ID: `10cd1d78ab55b20e143323bdf7f0f7080fc48a8f`

3.35 (HAL-35) EMIT POOL INFORMATION ON THE ADD POOL FUNCTION - INFORMATIONAL

Description:

The current implementation of the add pool function does not emit any information about the added pool to the rest of the system. (Pool ID) This makes it difficult for users to track and monitor the status of the newly added pool.

Code Location:

SavvyBooster.sol#L154

Listing 42: SavvyBooster.sol

```
1   function addPool(
2     uint256 amount_,
3     uint256 duration_
4   ) external override onlyOwner lock {
5     Checker.checkArgument(amount_ > 0, "amount must be greater
↳ than zero");
6     Checker.checkArgument(duration_ > 0, "duration must be
↳ greater than zero");
7
8     amount_ = TokenUtils.safeTransferFrom(address(svyToken), msg
↳ .sender, address(this), amount_);
9
10    uint256 totalDebtBalance = 0;
11    uint256 totalVeSvyBalance = 0;
12    uint256 poolStart = block.timestamp;
13    uint256 poolLength = pools.length;
14    if (poolLength > 0) {
15      PoolInfo memory lastPool = pools[poolLength - 1];
16      poolStart = lastPool.startTime + lastPool.duration;
17      totalDebtBalance = lastPool.totalDebtBalance;
18      totalVeSvyBalance = lastPool.totalVeSvyBalance;
19    }
```

```
20     PoolInfo memory pool = PoolInfo({  
21         remainingEmissions: amount_,  
22         emissionRatio: amount_ / duration_,  
23         duration: duration_,  
24         startTime: poolStart,  
25         totalDebtBalance: totalDebtBalance,  
26         totalVeSvyBalance: totalVeSvyBalance  
27     });  
28     pools.push(pool);  
29  
30     emit Deposit(amount_);  
31 }
```

Risk Level:

Likelihood - 1

Impact - 1

Recommendation:

It is recommended to implement a mechanism that emits information about the newly added pool to the rest of the system. This could be done using events or logging, and should include relevant information such as the pool's name, its id.

Remediation Plan:

SOLVED: The Savvy team solved this issue by adding pool length.

Commit ID: a6c125af3654a3c6b3c762fe28e71d54b859383c

AUTOMATED TESTING

4.1 STATIC ANALYSIS REPORT

Description:

Halborn used automated testing techniques to enhance the coverage of certain areas of the smart contracts in scope. Among the tools used was Slither, a Solidity static analysis framework. After Halborn verified the smart contracts in the repository and was able to compile them correctly into their abis and binary format, Slither was run against the contracts. This tool can statically verify mathematical relationships between Solidity variables to detect invalid or inconsistent usage of the contracts' APIs across the entire code-base.

Results:

```

YieldYokAdapter._deposit(uint256,address) (contracts/adapters/yieldyok/YieldYokAdapter.sol#78-93) sends eth to arbitrary user
  - vault.depositFor(value: amount){recipient} (contracts/adapters/yieldyok/YieldYokAdapter.sol#84)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#functions-that-send-ether-to-arbitrary-destinations

Multicall.mutcall(Cbytes[]]) (contracts/base/Multicall.sol#12-23) has delegatecall inside a loop in a payable function: (success,result) = address(this).delegatecall(data[i]) (contracts/base/Multicall.sol#15)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#payable-functions-using-delegatecall-inside-a-loop

      - (success,returnData) = target.call{value:(value)}(data) (node_modules/openzeppelin/contracts/utils/Address.sol#137)
External eth calls:
  - withdrawProtocolToken() (contracts/SavvyGE.sol#150)
    - (success,returnData) = target.call{value:(value)}(data) (node_modules/openzeppelin/contracts/utils/Address.sol#137)
State variables written after the call(s):
  - _setProtocolToken(protocolToken) (contracts/SavvyGE.sol#151)
    - protocolToken = newProtocolToken (contracts/SavvyGE.sol#365)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#reentrancy-vulnerabilities

TestVeSv.stake(uint256) (contracts/test/TestVeSv.sol#18-22) ignores return value by IERC20(csvToken).transferFrom(msg.sender,address(this),amount) (contracts/test/TestVeSv.sol#19)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#unchecked-transfer

SavvySage.weightings (contracts/SavvySage.sol#70) is never initialized. It is used in:
  - SavvySage.setWeight(address,address) (contracts/SavvySage.sol#12-19)
  - SavvySage.setWeights(address,address,uint256[]) (contracts/SavvySage.sol#180-215)
  - SavvySage._savvyAction(uint256,address,function,address,uint256) (contracts/SavvySage.sol#456-469)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#uninitialized-state-variables

SavvyLoanMigrator (contracts/SavvyLoanMigrator.sol#21-121) is an upgradable contract that does not protect its initialize functions: SavvyLoanMigrator.initialize(IISavvyLoanMigrator.InitializationParams) (contracts/SavvyLoanMigrator.sol#3-24-46). Anyone can delete the contract with: Multicall.mutcall(Cbytes[]]) (contracts/base/Multicall.sol#12-23) SavvyPositionManager (contracts/SavvyPositionManager.sol#29-1260) is an upgradeable contract that does not protect its initialize functions: ISavvyAdminActions.initialize(ISavvyAdminActions.InitializationParams) (contracts/interfaces/savvy/ISavvyAdminActions.sol#9) SavvyPositionManager.initialize(ISavvyAdminActions.InitializationParams) (contracts/SavvyPositionManager.sol#158-190). Anyone can delete the contract with: Multicall.mutcall(Cbytes[]]) (contracts/base/Multicall.sol#12-23) Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#unprotected-upgradeable-contract

SavvyLiq.getClaimable(address) (contracts/SavvyGE.sol#244-250) performs a multiplication on the result of a division:
  - accruedPerSecond = totalOwed / userBuyInfo[userAddress].duration (contracts/SavvyGE.sol#251)
SavvyGE._getAllocatedDeposits(address,address,uint256) (contracts/SavvyGE.sol#100-104) performs a multiplication on the result of a division:
  - allotedPerDepositToken = nftBoost * BASIS_POINTS (contracts/SavvyGE.sol#297)
  - allottedPerDepositToken = allottedPerDepositToken * nftBoost / BASIS_POINTS (contracts/SavvyGE.sol#311)
SavvyLoanMigrator._convertToBt(uint256,address,address) (contracts/SavvyLoanMigrator.sol#109-119) performs a multiplication on the result of a division:
  - underlyingValue = 10 ** yieldStrategyManager.getBaseTokensPerShare(yieldToken) / 10 ** TokenUtil.expectDecimals(yieldToken) (contracts/SavvyLoanMigrator.sol#117)
  - underlyingValue = 10 ** (18 - decimals(basedToken)) (contracts/SavvyLoanMigrator.sol#118)
BeefyVaultMock._withdraw(uint256,address,uint256) (contracts/test/beefy/BeefyVaultMock.sol#9) performs a multiplication on the result of a division:
  - r = (balanceC * shares) / totalSupply() (contracts/test/beefy/BeefyVaultMock.sol#94)
  - withdrawAmt = r - (r * forcedSlippage) / PERCENT_RESOLUTION (contracts/test/beefy/BeefyVaultMock.sol#98)
BeefyVaultMock.withdraw(uint256,address,uint256) (contracts/test/beefy/BeefyVaultMock.sol#85-104) performs a multiplication on the result of a division:
  - r = (balanceC * shares) / totalSupply() (contracts/test/beefy/BeefyVaultMock.sol#94)
  - checker.checkStateWithdrawn = r - (r * maxSlippage) / PERCENT_RESOLUTION, too much slippage (contracts/test/beefy/BeefyVaultMock.sol#99)
