### **Executive Summary**

Project Name Dojo

Project URL <u>www.dojov2.com</u>

Overview Dojo is an ERC20 token contract designed with an initial token

properties of a conventional token, allowing for approval,

transfers, and also allow for the contract owner to mint more in

the nearest future

Audit Scope <a href="https://etherscan.io/">https://etherscan.io/</a>

<u>address/0x54b3EEA2327C07D360d3fAab0851a76eA18b1DF8#code</u>

Contracts in Scope DojoToken

Commit Hash NA

**Language** Solidity

**Blockchain** Ethereum

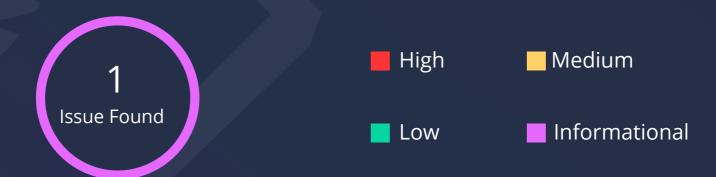

Method Manual Analysis, Functional Testing, Automated Testing

**Review 1** 4 August 2023 - 7 August 2023

**Updated Code Received** NA

Review 2 NA

Fixed In NA

	High	Medium	Low	Informational
Open Issues	0	0	0	0
Acknowledged Issues	0	0	0	1
Resolved Issues	0	0	0	0

Dojo - Audit Report

### **Types of Severities**

#### High

A high severity issue or vulnerability means that your smart contract can be exploited. Issues on this level are critical to the smart contract's performance or functionality, and we recommend these issues be fixed before moving to a live environment.

#### **Medium**

The issues marked as medium severity usually arise because of errors and deficiencies in the smart contract code. Issues on this level could potentially bring problems, and they should still be fixed.

#### Low

Low-level severity issues can cause minor impact and or are just warnings that can remain unfixed for now. It would be better to fix these issues at some point in the future.

#### Informational

These are severity issues that indicate an improvement request, a general question, a cosmetic or documentation error, or a request for information. There is low-to-no impact.

### **Types of Issues**

#### **Open**

Security vulnerabilities identified that must be resolved and are currently unresolved.

#### Resolved

These are the issues identified in the initial audit and have been successfully fixed.

### **Acknowledged**

Vulnerabilities which have been acknowledged but are yet to be resolved.

### **Partially Resolved**

Considerable efforts have been invested to reduce the risk/impact of the security issue, but are not completely resolved.

### **Checked Vulnerabilities**

Re-entrancy

✓ Timestamp Dependence

Gas Limit and Loops

Exception Disorder

✓ Gasless Send

✓ Use of tx.origin

Compiler version not fixed

Address hardcoded

Divide before multiply

Integer overflow/underflow

Dangerous strict equalities

Tautology or contradiction

Return values of low-level calls

Missing Zero Address Validation

Private modifier

Revert/require functions

✓ Using block.timestamp

Multiple Sends

✓ Using SHA3

Using suicide

✓ Using throw

✓ Using inline assembly

### **Techniques and Methods**

Throughout the audit of smart contract, care was taken to ensure:

- The overall quality of code.
- Use of best practices.
- Code documentation and comments match logic and expected behaviour.
- Token distribution and calculations are as per the intended behaviour mentioned in the whitepaper.
- Implementation of ERC-20 token standards.
- Efficient use of gas.
- Code is safe from re-entrancy and other vulnerabilities.

The following techniques, methods and tools were used to review all the smart contracts.

#### **Structural Analysis**

In this step, we have analysed the design patterns and structure of smart contracts. A thorough check was done to ensure the smart contract is structured in a way that will not result in future problems.

#### **Static Analysis**

Static analysis of smart contracts was done to identify contract vulnerabilities. In this step, a series of automated tools are used to test the security of smart contracts.

#### **Code Review / Manual Analysis**

Manual analysis or review of code was done to identify new vulnerabilities or verify the vulnerabilities found during the static analysis. Contracts were completely manually analysed, their logic was checked and compared with the one described in the whitepaper. Besides, the results of the automated analysis were manually verified.

#### **Gas Consumption**

In this step, we have checked the behaviour of smart contracts in production. Checks were done to know how much gas gets consumed and the possibilities of optimization of code to reduce gas consumption.

#### **Tools and Platforms used for Audit**

Remix IDE, Truffle, Truffle Team, Solhint, Mythril, Slither, Solidity statistic analysis.

Dojo - Audit Report

### **Manual Testing**

### A. Contract - DojoToken

### **High Severity Issues**

No issues found

### **Medium Severity Issues**

No issues found

### **Low Severity Issues**

No issues found

### **Informational Issues**

#### A.1 Unlocked pragma (pragma solidity ^0.5.16)

#### **Description**

Contracts should be deployed with the same compiler version and flags that they have been tested with thoroughly. Locking the pragma helps to ensure that contracts do not accidentally get deployed using, for example, an outdated compiler version that might introduce bugs that affect the contract system negatively.

#### Remediation

Here in-scope contract have an unlocked pragma, it is recommended to lock the same. Moreover, we strongly suggest not to use experimental Solidity features (e.g., pragma experimental ABIEncoderV2) or third-party unaudited libraries. If necessary, refactor the current code base to only use stable features.

#### **Status**

Open

Dojo - Audit Report

### **Functional Tests**

### Some of the tests performed are mentioned below

- Should get the name of the token
- should get the symbol of the token
- should get the decimal of the token
- should get the total supply of the token when deployed
- should get balance of the owner when contract is deployed
- should transfer tokens to other address
- should approve another account to spend token
- should confirm the inaccessibility of the burn function
- should mint into contract owner address and increase total supply
- should revert when non-owner calls the mint function

### **Automated Tests**

No major issues were found. Some false positive errors were reported by the tools. All the other issues have been categorized above according to their level of severity.

Dojo - Audit Report

### **Summary**

In this report, we have considered the security of DojoToken We performed our audit according to the procedure described above.

No Issues found in the Contract, Some suggestions and best practices are also provided in order to improve the code quality and security posture.

### Disclaimer

QuillAudits Smart contract security audit provides services to help identify and mitigate potential security risks in DojoToken smart contracts. However, it is important to understand that no security audit can guarantee complete protection against all possible security threats. QuillAudits audit reports are based on the information provided to us at the time of the audit, and we cannot guarantee the accuracy or completeness of this information. Additionally, the security landscape is constantly evolving, and new security threats may emerge after the audit has been completed.

Therefore, it is recommended that multiple audits and bug bounty programs be conducted to ensure the ongoing security of DojoToken smart contracts. One audit is not enough to guarantee complete protection against all possible security threats. It is important to implement proper risk management strategies and stay vigilant in monitoring your smart contracts for potential security risks.

QuillAudits cannot be held liable for any security breaches or losses that may occur subsequent to and despite using our audit services.. It is the responsibility of the DojoToken to implement the recommendations provided in our audit reports and to take appropriate steps to mitigate potential security risks.

### **About QuillAudits**

QuillAudits is a secure smart contracts audit platform designed by QuillHash Technologies. We are a team of dedicated blockchain security experts and smart contract auditors determined to ensure that Smart Contract-based Web3 projects can avail the latest and best security solutions to operate in a trustworthy and risk-free ecosystem.

**850+**Audits Completed

**\$30B**Secured
